Features:

1. DC-20GHz ultra-compact ultra-wideband.
2. Size 0.8*0.6*0.25 or 0.22mm, gold electrode, size & thickness consistent with active temperature compensation attenuation chip, easy to use.
3. Gold wire bonding, input and output pad size 0.17*0.31mm.
4. N3~ N10 Various slopes are available.
5. High reliability, no need for extra-5V power supply.
6. Improve impedance matching, reduce return loss between 2 adjacent power amplifiers, play an isolation protection role, and effectively prevent self-excitation.
7. Compared to active temperature compensation attenuators, passive one exhibit no distortion, phase shift, or time delay.
8. The application system is simple and flexibl with high reliability, reducing the hidden costs associated with system redesign.
9. When power increases, passive temperature compensation attenuators provide better and more stable temperature and frequency response characteristics than active tones, offering higher reliability.
10. Ultra small design, supporting for small multi-channel active phased array radars and chip-level micro-miniature transceiver module.

Applications:

- Miniaturized multi-channel active phased array radar
- Chip-level micro-miniature packaged transceiver modules
- Small active phased array radar for unmanned aerial vehicles

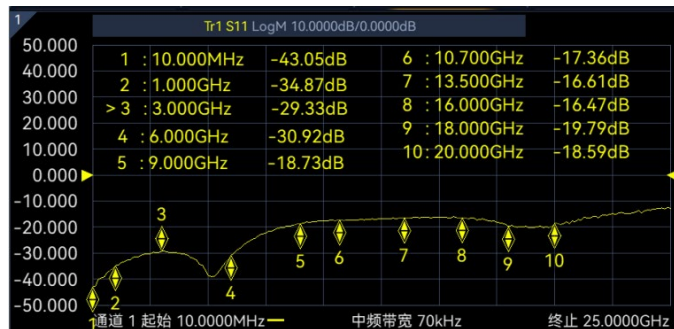

Unit Marking

dB Value (XX), Direction of Shift (N) and TCA Shift (X).
 Legibility and Permanency: per MIL-STD-130.

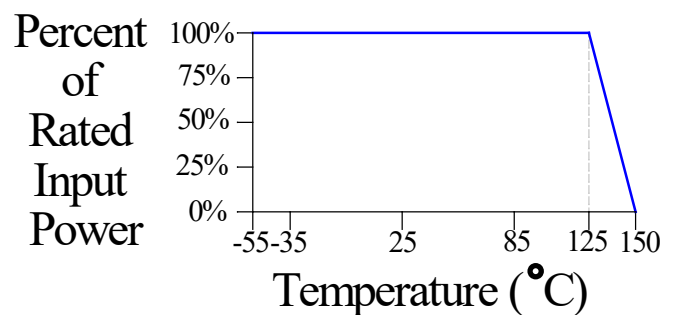

Quality Assurance

1. Sample inspect per ANSI/ASQC Z1.4 general inspection, LEVEL II, AQL = 1.0.
 - 1.1 Visual and mechanical examination for conformance to outline package requirements.
2. Select five (5) Units from lot measure attenuation from DC to 20 GHz every 20°C over the temperature range -55°C to +125°C.
 - 2.1 Calculate, using linear regression, the slope of the curve.
 - 2.2 Calculate TCA using the following formula: $TCA = \text{Slope} / \text{Attenuation} @ 25^\circ\text{C}$.
3. Test data required for customer.
